Bird recognition in the city of Peacetopia (case study)

LATEST SUBMISSION GRADE 100%

Problem Statement

This example is adapted from a real production application, but with details disguised to protect confidentiality.

You are a famous researcher in the City of Peacetopia. The people of Peacetopia have a common characteristic: they are afraid of birds. To save them, you have **to build an algorithm that will detect any bird flying over Peacetopia** and alert the population.

The City Council gives you a dataset of 10,000,000 images of the sky above Peacetopia, taken from the city's security cameras. They are labelled:

- y = 0: There is no bird on the image
- y = 1: There is a bird on the image

Your goal is to build an algorithm able to classify new images taken by security cameras from Peacetopia.

There are a lot of decisions to make:

- · What is the evaluation metric?
- · How do you structure your data into train/dev/test sets?

Metric of success

	,	,		
1. ⊦	las high accuracy			
2. F	tuns quickly and takes only a s	short time to classify a new imag	e.	
	3. Can fit in a small amount of memory, so that it can run in a small processor that the city will attach to many different security cameras.			
	te: Having three evaluation metrics makes it harder for you to quickly choose between two different orithms, and will slow down the speed with which your team can iterate. True/False?			
	True			
\circ	False			
,	✓ Correct			
• "	We want the trained model to	n let us know a bird is flying over	r Peacetopia as accurately as possible." ssify a new image."	
• "	We want the model to fit in 10	MB of memory."		
If yo	ou had the three following mo	dels, which one would you choo	se?	
\circ	Test Accuracy	Runtime	Memory size	
	97%	1 sec	ЗМВ

4. Structuring your data

9 500 000

Before implementing your algorithm, you need to split your data into train/dev/test sets. Which of these do you think is the best choice?

0	Train	Dev	Test
	6,000,000	3,000,000	1,000,000
0	Train	Dev	Test
	6,000,000	1,000,000	3,000,000
0	Train	Dev	Test
	3,333,334	3,333,333	3,333,333
	Train	Dev	Test

250.000

250.000

5. After setting up your train/dev/test sets, the City Council comes across another 1,000,000 images, called the "citizens' data". Apparently the citizens of Peacetopia are so scared of birds that they volunteered to take pictures of the sky and label them, thus contributing these additional 1,000,000 images. These images are different from the distribution of images the City Council had originally given you, but you think it could help your algorithm.

Notice that adding this additional data to the training set will make the distribution of the training set different from the distributions of the dev and test sets.

Is the following statement true or false?

"You should not add the citizens' data to the training set, because if the training distribution is different from the dev and test sets, then this will not allow the model to perform well on the test set."

○ True

False

False is correct: Sometimes we'll need to train the model on the data that is available, and its distribution may not be the same as the data that will occur in production. Also, adding training data that differs from the dev set may still help the model improve performance on the dev set. What matters is that the dev and test set have the same distribution.

6. One member of the City Council knows a little about machine learning, and thinks you should add the 1,000,000 citizens' data images to the test set. You object because:

This would cause the dev and test set distributions to become different. This is a bad idea because you're not aiming where you want to hit.

A bigger test set will slow down the speed of iterating because of the computational expense of evaluating models on the test set.

	The test set no longer reflects the distribution of data (security cameras) you most care about.			
	✓ Correct			
	The 1,000,000 citizens' data images do not have a consistent x>y (similar to the New York City/Detroit housing prices example from		s the rest of the data	
7.	You train a system, and its errors are as follows (error = 100%-Accuracy):		1 / 1 point
	Training set error	4.0%		
	Dev set error	4.5%		
	This suggests that one good avenue for improving performance is to tradown the 4.0% training error. Do you agree?	ain a bigge	er network so as to drive	
Yes, because having 4.0% training error shows you have high bias.				
	Yes, because this shows your bias is higher than your variance.			
	No, because this shows your variance is higher than your bias.			
	No, because there is insufficient information to tell.			
	✓ Correct			
8.	You ask a few people to label the dataset so as to find out what is huma following levels of accuracy:	an-level pe	erformance. You find the	1 / 1 point
	Bird watching expert #1		0.3% error	
	Bird watching expert #2		0.5% error	
	Normal person #1 (not a bird watching expert)		1.0% error	
	Normal person #2 (not a bird watching expert)		1.2% error	
	If your goal is to have "human-level performance" be a proxy (or estimate) for Bayes error, how would you define "human-level performance"?			
	0.0% (because it is impossible to do better than this)			
	0.0% (because it is impossible to do better than this)0.3% (accuracy of expert #1)			
	0.3% (accuracy of expert #1)			
	0.3% (accuracy of expert #1)0.4% (average of 0.3 and 0.5)			
	 0.3% (accuracy of expert #1) 0.4% (average of 0.3 and 0.5) 0.75% (average of all four numbers above) Correct			
9.	 0.3% (accuracy of expert #1) 0.4% (average of 0.3 and 0.5) 0.75% (average of all four numbers above) 			1 / 1 point
9.	 0.3% (accuracy of expert #1) 0.4% (average of 0.3 and 0.5) 0.75% (average of all four numbers above) Correct	l perform	ance but it can never be	1 / 1 point

	 A learning algorithm's performance can never be better than human-level performance nor better than Bayes error. 		
	A learning algorithm's performance can be better than human-level performance bayes error.		
	✓ Correct		
10.	You find that a team of ornithologists debating and discussing an image gets ar performance, so you define that as "human-level performance." After working f you end up with the following:		1/1 point
	Human-level performance	0.1%	
	Training set error	2.0%	
	Dev set error	2.1%	
	Based on the evidence you have, which two of the following four options seem (Check two options.) Try decreasing regularization.	the most promising to try?	
	✓ Correct		
	Get a bigger training set to reduce variance.		
	Try increasing regularization.		
	Train a bigger model to try to do better on the training set.		
	✓ Correct		
11.	You also evaluate your model on the test set, and find the following:		1 / 1 point
	Human-level performance	0.1%	
	Training set error	2.0%	
	Dev set error	2.1%	
	Test set error	7.0%	
	What does this mean? (Check the two best options.)		
	You should get a bigger test set.		
	You have overfit to the dev set.		
	✓ Correct		
	You should try to get a bigger dev set.		

	✓ Correct			
	You have underfit to the dev set.			
12.	After working on this project for a year, you finally achieve:			
	Human-level performance	0.10%		
	Training set error	0.05%		
	Dev set error	0.05%		
	What can you conclude? (Check all that apply.)			
	✓ It is now harder to measure avoidable bias, thus progress will be slower going forward.			
	✓ Correct			
	This is a statistical anomaly (or must be the result of statistical noise) since it should not be possible to surpass human-level performance.			
	If the test set is big enough for the 0.05% error estimate to be accurate, 0.05	this implies Bayes error is \leq		
	✓ Correct			
	With only 0.09% further progress to make, you should quickly be able to 0%	close the remaining gap to		
13.	It turns out Peacetopia has hired one of your competitors to build a system a competitor both deliver systems with about the same running time and men system has higher accuracy! However, when Peacetopia tries out your and your conclude they actually like your competitor's system better, because even the accuracy, you have more false negatives (failing to raise an alarm when a bird you do?	nory size. However, your our competitor's systems, they ough you have higher overall		
	O Look at all the models you've developed during the development process and find the one with the lowest false negative error rate.			
	Ask your team to take into account both accuracy and false negative rate	e during development.		
	Rethink the appropriate metric for this task, and ask your team to tune to	to the new metric.		
	O Pick false negative rate as the new metric, and use this new metric to drive all further development.			
	✓ Correct			
14.	You've handily beaten your competitor, and your system is now deployed in the citizens from birds! But over the last few months, a new species of bird h the area, so the performance of your system slowly degrades because your of type of data.	as been slowly migrating into		

You have only 1,000 images of the new species of bird. The city expects a better system from you within the next 3 months. Which of these should you do first?

•	Use the data you have to define a new evaluation metric (using a new dev/test set) taking into account the new species, and use that to drive further progress for your team.
0	Put the 1,000 images into the training set so as to try to do better on these birds.
0	Try data augmentation/data synthesis to get more images of the new type of bird.
0	Add the 1,000 images into your dataset and reshuffle into a new train/dev/test split.
	✓ Correct

15. The City Council thinks that having more Cats in the city would help scare off birds. They are so happy with your work on the Bird detector that they also hire you to build a Cat detector. (Wow Cat detectors are just incredibly useful aren't they.) Because of years of working on Cat detectors, you have such a huge dataset of 100,000,000 cat images that training on this data takes about two weeks. Which of the statements do you agree with? (Check all that agree.)

☑ If 100,000,000 examples is enough to build a good enough Cat detector, you might be better of training with just 10,000,000 examples to gain a ≈10x improvement in how quickly you can run experiments, even if each model performs a bit worse because it's trained on less data.

Needing two weeks to train will limit the speed at which you can iterate.

✓ Correct

Buying faster computers could speed up your teams' iteration speed and thus your team's productivity.

✓ Correct
